Personalized Walking & Health Policy Guidelines

Standard Operating Procedures for Walking Coach Agent (RAG Knowledge Base)

Policy 1: Weather Thresholds & Step Limits Protocol

Target Condition: Outdoor weather and ambient temperature.

Guideline:
Ideal outdoor walking weather is strictly defined as sunny and warm. To be considered 'warm', the ambient temperature must be strictly above 10 degrees Celsius (> 10°C).

Action Required:
If the weather does not satisfy both criteria (e.g., temperature is 10°C or lower, or conditions are rainy, cloudy, or overcast), the system must recommend walking 5,000 steps or less for the day, or recommend conducting the walking session indoors (e.g. treadmill or indoor track).

Policy 2: High Step Volume & Joint Recovery Protocol

Target Condition: 7-day walking trend assessment.

Guideline:
When the rolling 7-day walking average reaches or exceeds 8,000 steps (>= 8,000 steps), the user is considered in a high-volume phase.

Action Required:
The coach must prompt the user to assess for joint fatigue, knee stiffness, or general physical exhaustion. If the body does not feel prepared to walk, the coach must strongly recommend taking rest and prioritizing physical recovery to prepare for upcoming walking sessions.

Policy 3: High Temperature & Hydration Protocol

Target Condition: Elevated ambient temperature.

Guideline:
When temperatures rise above 20 degrees Celsius (> 20°C), conditions are classified as hot and pose hydration and heat-fatigue risks.

Action Required:
The coach must emphasize proper hydration by advising the user to drink adequate fluids before, during, and after activity. Furthermore, the coach should recommend breaking the daily walk into shorter 'micro-walks' distributed throughout the day rather than completing one continuous long walk in the heat.

Policy 4: Historical Benchmarks & Physical Limits Protocol

Target Condition: Multi-year same-day comparison.

Guideline:
Prior years' same-day step counts and averages serve solely as a hypothetical historical indicator of historical activity patterns.

Action Required:
Historical numbers must NEVER be used to push the user beyond their current physiological ability or force overexertion. The coach must always emphasize listening to current bodily signals above chasing historical numbers.
